Goldilogs Download

Goldilogs is a powerful but easy-to-use search tool for large event logs. Whether you need to find the source of an event, a specific line, a group of events, or any other specific information, Goldilogs is a must-have tool that will help you solve a wide range of problems. Goldilogs can index and search a large log file for specific data.

1. Field of the Invention The present invention relates to a method of managing memory used for various operations in a semiconductor device, and more particularly to a method of handling an initial setting of a stack space in the semiconductor device and providing an optimal stack space during a read operation.
2. Description of the Related Art The capability of a semiconductor device is dependent upon the operation of microprocessor components and it is not unusual to see 3 or 4 microprocessors on a single microchip. In order to ensure proper operation of the microprocessors, a system or software level memory management function is used to control memory allocation and usage. Memory is limited in that it can only be used to a certain extent and must be reallocated to another memory region to ensure optimum operation of the system. The system level memory management function is used to allocate memory to a variety of functional areas within the semiconductor device and manage the life cycle of that memory. This memory management function is commonly referred to as a "stack". The stack is a memory area that is used to store information used during the execution of the program. A stack can be described as a sequence of storage locations that can be addressed individually by adding or subtracting an amount of storage from the bottom of the stack. The stack may be conceptualized as an array of registers, or as a sequence of storage locations having a specific, limited size, where each location has a valid or invalid state indicating whether the location is free or occupied. In a stack, the lowest numbered register location is at the bottom of the stack and the highest numbered register location is at the top of the stack. The order of the locations, as they are addressed, defines the direction of the stack. The stack provides memory for certain functions which cannot fit in the main memory and helps to reduce the memory area needed for a particular program. For example, many instruction sets require that the operand information be placed on the stack. This includes adding (stacking) and removing (popping) the operand information from the stack. Thus, the stack is commonly used to store information that is

What's New In Goldilogs?

Microsoft Goldilocks is a small and free utility that helps you to search through the event logs and find your treasures in a timely manner. You can filter your log searches based on the Event Log, Application or even based on the Custom window. It is the perfect solution for those of you who like to organize your logs into folders and groups. Save search results into your specified folders, or to the clipboard. You can search both local and remote system.
